EDUCATION

Universal AI University **Mumbai**
Bachelor of Technology in AI & ML *2024 - Present*

WORK EXPERIENCE

AirBorneHRS **Remote**
Backend Developer Intern *Jun 2025 - Aug 2025*

- Contributed to backend services for a full-stack HRMS platform by designing and integrating REST APIs for employee, performance, and task management modules.
- Worked with Supabase (Postgres) to structure and query relational data models supporting organizational hierarchies and multi-role access across 100+ employee and task records.
- Owned API validation, access control logic, and database query flows for employee and task modules across development and staging environments.

Think Computers™ **Hybrid**
Software Development Intern, Cloud & DevOps *Apr 2026 – Jul 2026*

- Built a reusable CI/CD deployment framework for Flask applications using GitHub Actions, Docker, Amazon ECR, and EC2, automating testing, image builds, deployment, and post-deployment verification.
- Implemented health-based rollback using stable Docker image versions in AWS Systems Manager Parameter Store, validating application availability, database connectivity, and deployed version before marking releases successful.
- Designed a serverless AI-assisted log analysis pipeline using API Gateway, Lambda, DynamoDB, and SNS, with input/response validation, exception handling, severity classification, and automated alerts.

PROJECT EXPERIENCE

ResolveFlow: Hybrid ML-Based Complaint Triage System- GitHub

- Architected a hybrid ML system using Scikit-learn-based text classification and rule-driven logic to route multi-label complaints across operational teams.
- Built a student-facing intake portal and triage dashboard with audit logging, decision queues, and SLA-based human override workflows.
- Benchmarked the system on a 150+ sample test set, reducing average manual routing time by ~40% versus a baseline manual process.

Tech Stack: *Python, Flask, Scikit-learn, SQLite, HTML, Tailwind CSS, JavaScript*

PathForge: Automated Code Analysis & Algorithm Strategy Detection Platform- GitHub | Live

- Built a full-stack platform that performs structural analysis of Python solutions using AST-derived evidence to identify algorithmic techniques and strategies such as sliding window, binary search, dynamic programming, and monotonic stacks.
- Designed an evidence-based strategy matching system supporting multiple valid solution approaches and CONFIRMED / UNRESOLVED / CONTRADICTED outcomes rather than relying on textual or keyword matching.
- Evaluated the analyzer across 40+ implementation variants and 80+ real submissions, recording zero false confirmations or contradictions in the evaluated corpus.

Tech Stack: *Python, Flask, PostgreSQL, Supabase, Next.js, TypeScript, AST analysis*

FOUNDATIONS & SKILLS

Training: AWS Educate — Introduction to Cloud 101; Getting Started with Databases; Getting Started with Networking; Getting Started with Serverless; Getting Started with Storage; Getting Started with Cloud Operations.

Programming: Python, C++, Java
Backend & Data: Flask, REST APIs, PostgreSQL, Supabase, MongoDB
Cloud & DevOps: AWS (EC2, ECR, Systems Manager Parameter Store, Lambda, API Gateway, DynamoDB, SNS), Docker, GitHub Actions, CI/CD

CERTIFICATIONS & ACHIEVEMENTS

Certifications: DataCamp (Prompt Engineering, Excel for Data Analysis), Google Cloud (Prompt Design in Vertex AI), edX (Sustainable Development, Carbon Capture & Storage)
Achievements: Led and organized robotics events as General Secretary of the Robotics Club, coordinating 50+ participants and cross-team collaboration, Ranked in the top 10 students in the cohort by academic CGPA for 2 concurrent years.
